

Summary Report

Manual testing covered the Training module's new requirement: building a 20-30 question bank and randomly assigning 5-10 questions per crew member.

The core requirement is implemented and works - a question bank can be built (via Auto Generate or Manual Generate) and randomly assigned per crew. Retested end-to-end with a real 30-question bank and two crew accounts: each received 5 questions with only partial overlap, confirming genuinely different question SUBSETS per crew member, not just a different order.

The most significant finding is a discoverability gap (Critical): the per-crew/Random configuration is not visible unless a specific, undocumented sequence is followed on either authoring path.

Two High-severity issues were found: no "unsaved changes" warning before losing in-progress work, and script/HTML tags being accepted verbatim in text fields with output-side rendering not yet verified.

The remaining defects are Medium or Low severity: inconsistent field validation, a checkbox control that behaves like a radio button (confirmed consistent - only one answer can ever be selected, in both the admin authoring UI and the crew quiz), no way to restore a deleted answer option, an intermittent 401 on a dashboard API call, missing inline messages on a couple of disabled buttons, and no minimum number of questions enforced before publish.

11 defects and 1 observation were logged in total, none of which required deleting or altering existing application data.

Full reproduction steps, evidence, and severity/priority ratings for every item are in Test_Cases.xlsx (Defects sheet).
